Sustain-ability Essay

Doing good better.

As a startup, we can do a number of things right from the start - for example, think sustainably from the outset, check structures for sustainability, buy, consume and invest with social responsibility, and communicate and act in a socially sustainable manner. Of course, we can sign on to the UN's 17 Sustainable Development Goals (SDGs)

and endorse all that is in the 2030 Agenda for global sustainable development. The Agenda is a roadmap for the future, and we, too, must align our actions with it. - After all, a lot is at stake and everything matters. Every contribution counts. In particular, we find ourselves in the following Agenda points:

Decent work and economic growth

We use our resources sparingly, especially our financial resources. Nevertheless, performance is always rewarded appropriately at our company. For us as a startup, sustainable corporate management means being in harmony with our ecological and social responsibilities and growing profitably in the long term within our frame of reference and our scope of action. Compliance with the law is, of course, a prerequisite.

Partnerships to achieve the goals

Our goal is to deal with each other on an equal footing, free of fear and respect. We interact internally and externally in a spirit of partnership and fairness. Diversity and a variety of perspectives are important to us. We respect the uniqueness of every individual. In particular, the different individual perspectives of our employees enrich and complement each other to form a large, colorful whole. This diversity makes us creative, effective and reliable as a team and in terms of service excellence.

High quality education / gender equality

Our products, both **sfs-healthcare®** and the associated services, are designed for sustainable learning and performance effects and will make their contribution to more high-quality education and training as well as better understanding and highly developed skills in the healthcare sector. Gender equality, respectful interaction and, last but not least, linguistically balanced cooperation are our declared goals.

Industry, innovation and infrastructure

Our goal is to build a resilient infrastructure for developers and developments with the possibility of scaling effects and to drive further innovations in addition to **sfs-healthcare®**.

Our vision is to make the digitization of structures and processes in healthcare easier, better, faster and simpler in a global competitive comparison through the use of our software. We support the objectives of the GERMAN SUSTAINABILITY STRATEGY … the promotion of digital competencies of people and employees in hospitals and healthcare institutions.

Sustainable consumption and production

We see Green Coding as a primary part of our sustainability program. In doing so, we already think and program sustainably from the planning stage, during implementation, and in the software architecture.

Behind Green Coding is the idea of designing, developing, and executing our software in an environmentally friendly way, with the goal of producing emissions-free code. Apart from reducing emissions, green code also reduces long-term costs, especially through lower power consumption, which ultimately makes it attractive to our software users.
